Assessment of Myocardial Perfusion in Coronary Artery Disease by Magnetic Resonance

A Comparison With Positron Emission Tomography and Coronary Angiography

J. Schwitter, MD; D. Nanz, PhD; S. Kneifel, MD; K. Bertschinger, MD; M. Büchi, MD; P.R. Knüsel, MD; B. Marincek, MD; T.F. Lüscher, MD; G.K. von Schulthess, MD, PhD

Circulation. 2001;103:2230-2235.

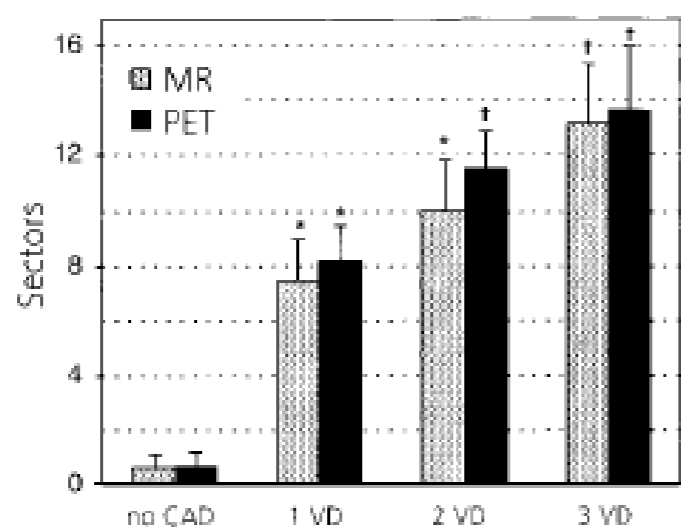

Figure 4. Comparison of pathological sectors, as defined by MR and PET, in patients with 1-, 2-, and 3-vessel disease (VD) and no disease (for details, see Results). There was a trend toward underestimation of the extent of disease by MR ($P=0.22$ vs PET). * $P<0.05$ vs no disease, † $P<0.01$ vs no disease (2-way ANOVA for repeated measures, Bonferroni-corrected; error bars represent SEM).

CMR vs PET

S:87% E:85%

Figure 6. For all 3 coronary arteries, the sensitivities and specificities of subendocardial MR data to detect $\geq 50\%$ stenoses, as defined by QCA, were similar, indicating that the quality of MR data was similar throughout the left ventricular myocardium.

CMR vs QCA

Noninvasive Assessment of Myocardial Perfusion

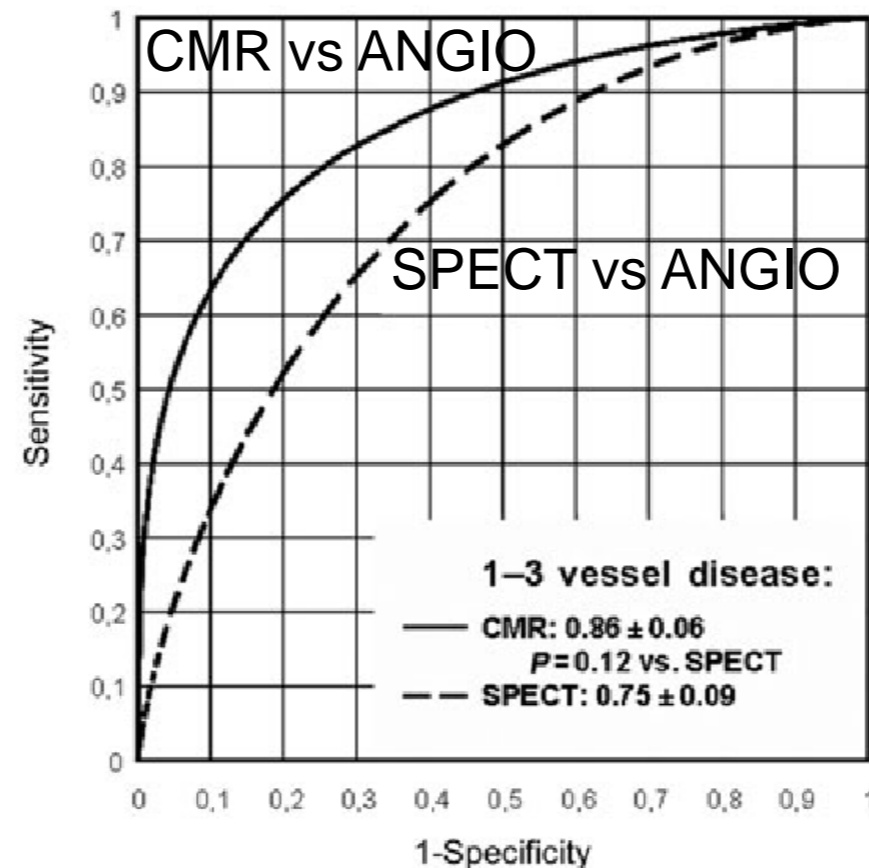

Michael Salerno, MD, PhD; George A. Beller, MD

Table 2. Pooled Diagnostic Performance of Perfusion Imaging Techniques

Modality	n	CAD Prevalence	Sensitivity	Specificity
SPECT ²⁷	4480	76%	0.87 (0.86–0.88)	0.73 (0.70–0.76)
PET ³⁸	1442	77%	0.85 (0.79–0.90)	0.87 (0.84–0.90)
CMR ⁷⁵	1516	57%	0.91 (0.88–0.94)	0.81 (0.77–0.85)
Echocardiography ⁴⁶	1088	69%	0.82 (0.76–0.88)	0.80 (0.73–0.87)

Impact of Unrecognized Myocardial Scar Detected by Cardiac Magnetic Resonance Imaging on Event-Free Survival in Patients Presenting With Signs or Symptoms of Coronary Artery Disease

Raymond Y. Kwong, MD, MPH; Anna K. Chan, MBBS; Kenneth A. Brown, MD; Carmen W. Chan, MBBS; H. Glenn Reynolds, MSc; Sui Tsang, BS; Roger B. Davis, ScD

Circulation 2006;113:2733-2743

Patient Population

We studied a consecutive series of patients with symptoms or signs suspicious of CAD who underwent CMR for clinical purposes. Patients had either (1) an unknown status of CAD and were referred for assessment of LV function and myocardial scar as part of a noninvasive CAD work-up or (2) known angiographically determined CAD and were referred for prediction of segmental wall motion recovery after revascularization. Patients with any of

but no history of MI
